**COMPACT SOLUTIONS ANNOUNCES LIMITED RELEASE OF
PATH-BREAKING AGILE DATA ANALYTICS TECHNOLOGY**

Compact's Agilytix now available for partners in select industries

OAKBROOK TERRACE, IL; Mar. 16, 2010 –Compact Solutions, a premier solutions provider specializing in enterprise information management solutions, today announced limited release of Agilytix, its path-breaking data analytics technology. This technology makes very large volumes of historical transactional data available to power users for use in complex analytical models. This new technology readies organizations for the deluge of transactional data they must analyze not just for strategic decision making but also for operational decisions.

Agilytix is now being released to partners in the banking, financial services, insurance (BFSI) and travel and transportation (T&T) sectors. Compact is on track to make Agilytix available for general adoption, with partners and with direct, end-user customers in the third quarter this year.

“For reasons of cost and time, enterprise data warehouses (EDWs) have had to limit the amount of historical transactional data in EDWs, limiting the power and speed of complex analytical needs of an enterprise,” said Pankaj Agrawal, Compact’s CEO and CTO. “The EDW serves so many users that the complex queries submitted by these power users do not perform well, if at all. This imposes a great burden on the EDW that has to also serve the needs of a large number of users that either want canned reports or who do simple ad-hoc analysis on small amounts of data. Besides, power users often request new sets of attributes to be added to the EDW. This is difficult to achieve in traditional EDW architectures. So, an agile architecture is needed to support the peculiar needs of power analysts in today’s enterprises. Compact’s Agilytix addresses these needs beautifully. It is a solution to put unlimited amounts of historical transactional data in the hands of enterprise business analysts at a fraction of the cost of traditional solutions”

Compact has targeted its Agilytix technology to provide a way to meet the power users’ needs for agility and for handling truly gigantic amounts of transactional data for complex analytics. Agilytix complements existing EDW architectures.

COMPACT SOLUTIONS ANNOUNCES AGILYTIX—PAGE 2

“In the coming years, data warehouses and data analytics will need to be integrated into systems that support decision making at the transactional level. The real opportunity ahead is to harness this data, transform it into information and deliver that insight into the hands of people who can use it to increase value, advantage and profit across your organisation without barriers or compromise... Agilytix from Compact will make it possible for businesses to remain agile and alive to the insights available in their data stores,” Agrawal adds.
